

# Habits, Haunts, and Anecdotes of the Moose and Illustrations From Life

By A. J. Stone

The moose is a large, ungulate mammal that is native to North America and Eurasia. It is the largest member of the deer family, and is known for its long legs, large antlers, and distinctive humped back. Moose are typically found in forests and wetlands, where they feed on a variety of vegetation. They are solitary animals, but will sometimes form small groups during the winter months.

Moose are generally shy and elusive animals, but they can be dangerous if they feel threatened. They have been known to charge at people and vehicles, and have even been known to kill humans. However, moose are typically more afraid of humans than humans are of them, and they will usually avoid contact if possible.
